Ex. No.: 6d ROUND ROBIN SCHEDULING

Date: 26.03.2025

Aim:

To implement the Round Robin (RR) scheduling technique using C programming.

Algorithm:

- 1. Start.
- 2. Get the number of processes and the time quantum from the user.
- 3. Read the process burst time (arrival time is assumed 0 for simplicity).
- 4. Initialize an array rem_bt[] (remaining burst time) as a copy of burst time.
- 5. Initialize an array wt[] (waiting time) as 0 for all processes.
- 6. Set current time t = 0.
- 7. Repeat while all processes are not completed:
 - o For each process i:
 - If rem_bt[i] > 0:
 - If rem_bt[i] > quantum:
 - t += quantum
 - rem_bt[i] -= quantum
 - Else:
 - t += rem_bt[i]
 - wt[i] = t bt[i]
 - rem_bt[i] = 0
- 8. Calculate Turnaround Time for each process as: tat[i] = bt[i] + wt[i]
- 9. Compute Average Waiting Time and Average Turnaround Time.
- 10. Display the process-wise result.
- 11. End.

Program Code (C):

#include <stdio.h>

```
int main() {
  int i, n, time = 0, quantum;
  int bt[20], rem_bt[20], wt[20], tat[20];
  float avg_wt = 0, avg_tat = 0;
  printf("Enter total number of processes: ");
  scanf("%d", &n);
  printf("Enter burst time for each process:\n");
  for (i = 0; i < n; i++) {
    printf("P[%d]: ", i + 1);
    scanf("%d", &bt[i]);
    rem_bt[i] = bt[i];
    wt[i] = 0;
  }
  printf("Enter Time Quantum: ");
  scanf("%d", &quantum);
  int done;
  do {
    done = 1;
    for (i = 0; i < n; i++) {
       if (rem_bt[i] > 0) {
         done = 0;
         if (rem_bt[i] > quantum) {
           time += quantum;
           rem_bt[i] -= quantum;
         } else {
           time += rem_bt[i];
           wt[i] = time - bt[i];
```

```
rem_bt[i] = 0;
         }
      }
    }
  } while (!done);
  printf("\nProcess\tBurst Time\tWaiting Time\tTurnaround Time\n");
  for (i = 0; i < n; i++) {
    tat[i] = bt[i] + wt[i];
    avg_wt += wt[i];
    avg_tat += tat[i];
    printf("P[\%d]\t\%d\t\t\%d\n", i + 1, bt[i], wt[i], tat[i]);
  }
  avg_wt /= n;
  avg_tat /= n;
  printf("\nAverage Waiting Time = %.2f", avg_wt);
  printf("\nAverage Turnaround Time = %.2f\n", avg_tat);
  return 0;
}
```

Sample Output:

Enter total number of processes: 4

Enter burst time for each process:

P[1]: 5

P[2]: 15

P[3]: 4

P[4]: 3

Enter Time Quantum: 5

Process Burst Time		Waiting Time	Turnaround Time
P[1]	5	0	5
P[2]	15	12	27
P[3]	4	5	9
P[4]	3	9	12

Average Waiting Time = 6.50

Average Turnaround Time = 13.25

Result:

The Round Robin Scheduling algorithm was successfully implemented and tested. It correctly calculated the waiting and turnaround times based on the given time quantum.
